Il contributo delle scienze umane alla liason psichiatrica

Roberto Franchini, Segretario SIDiN, Università Cattolica del Sacro Cuore, Responsabile Area Strategica e Sviluppo Opera Don Orione Italia,

Corrado Cappa, Consigliere SIDiN, Psichiatra Dipartimento Salute Mentale e Dipendenze Patologiche AUSL Piacenza

Il corpo escluso

A photograph of three dancers in black leotards performing a contemporary dance piece. One dancer is seated in a wheelchair, while the other two are in dynamic poses, one suspended in the air and the other in a low, extended pose. The background is a plain, light-colored studio floor and wall.

Revisione dell'editing
Lorenzo Benini

- Adverse childhood experiences
- Discrimination or social exclusion
- Exposure to violence
- Criminal justice involvement

Highly detrimental U.S. societal problems

Socioeconomic status and opportunities for accruing wealth

- Low educational attainment
- Unemployment or job insecurity
- Poverty and income inequality
- Neighborhood poverty

- Adverse built environment
- Neighborhood disorder
- Pollution
- Global climate change impact

Immediate and global physical environment

Basic needs in terms of housing, food, transportation, and health care

- Housing instability
- Food insecurity
- Poor access to transportation
- Poor access to health care

Prescribing psychotropic drugs to adults with an intellectual disability

Julian N Trolor

Table 1 Common medical comorbidities in people with intellectual disability that may alter the choice of psychotropic drug

| Comorbidity | Associated genetic syndromes | Prescription implications |
|---|--|--|
| Epilepsy | Down, Fragile X, Angelman, Tuberous sclerosis, Rett, Wolf-Hirschhorn | Exercise caution prescribing psychotropics that lower seizure threshold, e.g. clozapine, tricyclic antidepressants, venlafaxine |
| Obesity | Down, Turner, Angelman, Prader-Willi | Avoid psychotropics with high cardiometabolic liability as first-line treatment |
| Dyslipidaemia | Down, Turner, Prader-Willi | Avoid psychotropics with high cardiometabolic liability as first-line treatment |
| Type 2 diabetes | Down, Turner, Sotos, Prader-Willi | Avoid psychotropics with high cardiometabolic liability as first-line treatment |
| Hypertension | Turner, Tuberous sclerosis, Williams, Sotos, Prader-Willi | Exercise caution prescribing psychotropics known to raise blood pressure, e.g. venlafaxine, desvenlafaxine, duloxetine |
| Hypotension | Down | Where possible avoid psychotropics with potential to exacerbate, e.g. chlorpromazine, tricyclic antidepressants, quetiapine |
| Respiratory difficulties or structural airway abnormalities | Prader-Willi, Down | Where possible avoid highly sedating psychotropics that may exacerbate the risk of respiratory failure |
| Swallowing difficulties | Cerebral palsy | Exercise caution with psychotropics that exacerbate swallowing difficulties, e.g. clozapine, olanzapine, risperidone, quetiapine |
| Early onset dementia | Down | Be aware that cognitive adverse effects of some psychotropics may compound cognitive dysfunction in emerging dementia |

*Silenzio:
nel dirupo inaccessibile,
al fondo,
il prato in fiore*
